MEASURING DISTANCE TYPE OBSTACLE DETECTION SENSOR PBS-03JT-V01

INSTRUCTION MANUAL

Be sure to read this instruction manual carefully before using to make correct operation of this device.

Be sure to read this instruction manual and keep properly.

Notice of safety(to be continued)

- * The critical injury stated above means causing after effect by loss of eyesight, injury, burn(high temperature, low temperature), electric shock, fracture, poisoning etc., and necessity of hospitalization or long time attending to hospital for care. The middle injury or slight injury means injury, burn, electric shock etc. which are not necessary of hospitalization or long time attending to hospital for care. The physical damage means damage of property and equipment and enlarged damage relevant to damage of equipment.
- * These notice for safety informs more important supplementary contents regarding to HOKUYO Obstacle Detection sensor. The customers should establish the safety measure according to various standards and criteria for the sake of safety operation and maintenance of equipment & device.

The following danger mark is for HOKUYO Obstacle Detection Sensor. If this danger instruction may not be kept, it is possible to cause an accident resulting injury or death. Please note that the order of this instruction is never adopted order in important level and instruction stated here are all important matter.

DANGER	Pages
* This product is auxiliary safety device and isn't complete safety device. When device is used for	5
application that may occur serious accident, make sure to prepare other safety device such as	
bumper sensor etc. Also, take necessary measures such as backup circuit etc.	
* This sensor is possible to cause malfunction or mis-detection by reasons of strong disturbance light,	6
electric noise or mechanical vibration.	
* Make sure that the power source is off when maintenance and inspection.	6
* Take caution to handle the device and don't hit against or drop off.	6
* This device can't detect a dead space of view in beam scanning angle. If necessary detecting area	6,13
isn't enough, don't use it.	

The following caution mark is for HOKUYO Obstacle Detection sensor. If this caution instruction may not be kept, it is possible to cause an accident resulting injury or death. Please note that the order of this instruction is never adopted order in important level and instruction stated here are all important matter.

	CAUTION					
* Be sure instruc	e to read the instruction manual carefully before ction manual to final user and be sure to keep th	servicing thi e instruction	is device. Be sure to reach the manual by final user.	4		
* This de period	evice doesn't operate for approx. 1 sec after putti	ng power so	urce on. Don't use during this	6		
* Use po source	ower source with 2A or more, current capacity. e in. Voltage min. and max. value is 12 to 24V	Inrush cur DC.	rent flows when putting power	6		
* Avoid to install at the places where strong light over rated enters into reception part. It may cause mis-operation.				6		
* It takes approx. 1 sec. from releasing emission-stop input to rebooting.						
* If 2-scanning mode is used, response time is getting slower.						
* If area is changed by outer input, response time is getting slower.						
* Min. detectable object is getting larger under mirror reflecting avoidance mode.						
* It can set detecting range up to 10m under within 218 degrees but we can't guarantee it.				13		
* Area from scanning center of sensor to 0.2m is dead zone and it can't detect.			13			
* When installation, don't close light-projection/reception window or interrupt area.			14			
* If cover is used, use cover with high transparency.			14			
* Response time is delayed under much mutual interference				16

1. Caution for handling

It may cause misdetection even out of detection area because of characteristics in case that there is strong light from mirror surface or retro-reflection plate. In that case, take measures to avoid such situation.

- * This sensor is possible to cause malfunction or mis-detection by reasons of strong disturbance light, electric noise or mechanical vibration.
- * Make sure that the power source is off when maintenance and inspection.
- * Take caution to handle the device and don't hit against or drop off.
- * This device can't detect a dead space of view in beam scanning angle. If necessary detecting area isn't enough, don't use it.

CAUTION

* This device doesn't operate for approx. 1 sec after putting power source on. Don't use during this period.

- * Use power source with 2A or more, current capacity. Inrush current flows when putting power source in. Voltage min. and max. value is 12 to 24VDC.
- * Avoid to install at the places where strong light over rated enters into reception part. It may cause mis-operation.

PROHIBITION

- * Don't decompose this device. It may cause any troubles by short-circuit. Moreover it may cause malfunction of device out of warranty.
- * Keep this device out of soaking in water, oil or scales. Light-receiving amount is reduced and it may cause mis-detection. Also, inner circuit corrodes and it may cause any troubles.
- * Don't install or keep this device at the place where over rated heat, vibration or shock. It may cause any troubles or malfunction.
- * Avoid to use under solvent vapor and corrosive gas.

---	-----------	------

ENFORCEMENT

* Clean up lens surface of both light-projecting and receiving part with soft cloth periodically. When lightprojecting and receiving part are dirty, it can't keep specific detection area.

* Don't make a wiring with power line such as driven motor or break.
* Earth frame ground terminal to the body when switching regulator is used as power source.

Model No. PBS-03JT-V01 Power source 12 to 24VDC (ripple within 10%) Current consumption 500mA or less when emission stops) (Note) Except for I/O terminal current and rush current(500mA) Detectable object and White kent paper with 300 × 300mm(Placed in parallel with sensor projecting/ receiving surface) Area with vertical direction 0.2 to 3m and width 2m(Origin point is scanning center position) but within scanning angle 180 degrees Hysteresis If specifies the width when each area setting(Original value : 10%) 10% of detecting distance(It is not getting 30mm or less) 5% of detecting distance(It is not getting 30mm or less) 5% of detecting ing intrance(It is not getting 30mm or less) Output 1 Photo-coupler/open-collector output(30VDC 50mA Max.) Titla	Measuring Distance Type Obstacle Detection	Drawing	C 41 2430	7/10
THE	Sensor PBS-03JT-V01 Instruction Manual	No.	C-41-2430	//19

About detecting characteristics

If reflectance is extremely bad(mourning dress or oil-stained working clothes etc.), it is impossible to measure even if detection distance is within 1m. Also, it can't detect mirror-surface objects such as stainless polished surface stably. Detecting precision(Reference value) is ± 0.1 m up to 1m and is ± 0.1 time against the distance at 1m or more in case of kent paper with 300×300 mm. Detecting error with lower reflectance is getting larger. We recommend to test with a sample.

2 Specifications(Continued)				
2. Specifications (Continue	Input taking-in cycle : 1 scanning time(100ms or 110ms)			
Input response time	(When selecting emission stop by external input, input taking-in cycle is 1msec)			
(Note) It can set detecting area up to 10m but it isn't under our guarantee.				
3. Functions				
3-1. How to set detecting area				

It can set detecting area which was made by software with serial input/output.

3-2. Stop emission

When this sensor is not required in the places where AGV stops etc., we recommend to use emission-stop function because of preventing the interference. Scanning revolution and emission of LED stop when all input(1 to 4) are getting ON(L level).

CAUTION It takes approx. 1sec. from releasing emission-stop input to rebooting.

3-3. Setting detection area pattern changeover

Setting detection area pattern can be changed with [Input 1], [Input 2], [Input 3] and [Input 4].

CAUTION

<u>* If area is changed by outer input, response time is getting slower.(Changeover time with approx. 100 to 110msec is added to response time.)</u>

3-4. Trouble output

When revolution of scanner(Motor) stopped or it didn't receive LED's beam as standard emission light, trouble output(Output 4) executes. Also, output 1, 2 and output 3 is the state it is detecting any obstacle. and power lamp flickers with 1 sec interval.

3-5. 2-scanning operating mode

Normal mode executes output with 1 scanning result but this mode executes output with 2-scanning continuous result and so malfunction by unstable reflective light hardly cause.

* If 2-scanning mode is used, response time is getting slower.

* In case of light interference, response time is widely delayed under 2-scanning mode.

3-6. Low-speed scanning mode

Scanning time is getting 110msec. This is used for holding response delay by mutual Interference(When PBS's face each other) within 1 scanning.

CAUTION * If low-scanning mode is used, response time is getting slower.

Titla	Measuring Distance Type Obstacle Detection	Drawing	C 41 2420	0/10
The	Sensor PBS-03JT-V01 Instruction Manual	No.	C-41-2430	9/19

3-7. Hysteresis changeover

When it sets detecting area near wall, make hysteresis small. If wall surface is within hysteresis range of detecting area, output doesn't return.(After AGV or human being passed detecting area, it detects wall surface and AGV can't move.)

4. Connection and operating

4-1. Colors and signals

Colors	Functions	
Black	Output 1	
White	Output 2	
White(Blue)	Output 3	
Orange	Trouble output	
Gray	Output common minus	
Red	Input common plus	
Green	Input 1	
Yellow	Input 2	
Purple	Input 3	
White(Yellow)	Input 4	
Brown	+VIN	
Blue	-VIN	
Yellow(Red)	Serial input(RXD)	
Yellow(Green)	Serial output(TXD)	
Yellow(Black)	Serial GND	

Colors in parenthesis indicate ink color of both sides line printing. Input/output direction is mentioned on the

basis of PBS.

* Connect unused input cable to input common +(Red) or open it. Connect unused output cable to output common –(Gray) or open it.

4-2. Operating lamp

5. Detecting area setting

5-1. Detecting area setting software

Start application software and set detection area with mouse or numerical input, referring monitor of PC. It is convenient to make a fine adjustment of detection area because of checking operating state with monitor of PC. Each setting area can be saved in file. See instruction manual of software application in details.

D ENFORCEMENT

Be sure to adjust, checking detecting area data and real time data with application software. Check operating state after setting.

Title	Measuring Distance Type Obstacle Detection	Drawing	C 41 2420	11/10
	Sensor PBS-03JT-V01 Instruction Manual	No.	C-41-2430	11/19

There are the following 3 kinds of detecting area setting for output 2 and output 3 and it can be free to select.

Q	If a detection object is not more than white kent paper with 300 by 300mm, does it operate correctly?						
Α	A The standard of light amount margin is 1.5 times at 3m with 300 by 300mm white kent paper and so						
	detect mourning dress or transparent plate etc. with low reflectance. In case of detecting object such as						
	mirror surface, it can 't detect stably. Moreover, in the case of a detection objects thinner than a width of						
	300mm, PBS can't detect if detection distance is 3m or more because PBS's beam which becomes fan-shape						
	with equal angle is stepped. However, in case of within 3m, thinner detection object can be detect.(100mm						
	or more at 1m)						
Q	What is detecting precision?						
Α	It is +/- 10cm at within 1m and is +/- 0.1 time against setting value at 1m or more.						
Q	Is it possible to set 1m or more for width direction?						
Α	When area is set for width direction, it is set within 1.5m and check actual area.						
Q	When installing PBS, how far can it cover except for light-projection/reception part?						
Α	If it installs so that it may stick out 50mm or more, there is no problem. Consider installing status, referring						
	scanning angle and the following beam diameters. Since the beam spreads proportionally such as 20mm in						
	diameter for min., 50mm in diameter at 1m and 80mm in diameter at 2m and so install it not to interrupt such						
	area.						
Q	Is it possible to use under water splashing?						
А	Even if any drop of water attached, it can use after wiping but we can't guarantee to use at the places under						
	any drop of water.						
Q	When PBS suddenly receives a strong vibration during operating, how does it operate?						
Α	It will not affect if it is within 70Hz is less than and double amplitude of 1.5mm (X, Y and Z directions).						
	When motor is getting unstable by over-rated vibration for the above value, detection output is forcibly getting						
	detection state once but if vibration time isn't beyond 1sec., return automatically within 1sec.(When motor is						
	during unstable, power lamp flickers with 0.1sec interval.)						
	During self recovery, for motor rotation to return to the normal state the excitation current will increase for 10						
	seconds. If "synchronization loss" occurs 4 times (5 times including initial trial) during the recovery process,						
	it is judged that the sensor is abnormal.						
	Moreover, if "loss of synchronization" occurs 10 times within 1200 scans (120 seconds), it is judged that the						
	sensor is abnormal.						
	However, if such trouble(unstable motor) is temporary and there is no damage on motor,						
	trouble output returns after putting power source in again.						
11.7	Trouble						

When you felt irregular operation to this device, make sure to stop to use and inspect it. If you couldn't find out any reason, contact our offices. Trouble-shooting is as per following table:-

Trouble	Countermeasure		
Power lamp doesn't light up	* Check wiring is correct or not.		
	* Check power source voltage.		
Detection output doesn't change	* Check input/output wiring is correct or not.		
	* Check installation is correct or not.		
	* Check setting are is correct or not.		
	* Check area setting that is considered about sensor hysteresis or not.		
	* Check scanning view is within 180 degrees or not on area setting.		
Power lamp keeps on flickering	* Device is out of order. Replace it by new one.
